SUMMARY

Software Engineer with 5+ years at Amazon building full-stack applications and distributed systems at scale in Java, TypeScript, and React. Proven track record shipping high-impact features across UI, backend APIs, and data infrastructure.

TECHNICAL SKILLS

Languages/Frameworks: Java, JavaScript, Typescript, React, Node.js, Python, CSS, HTML

AWS: SNS, SQS, DynamoDB, Lambda, Glue, S3, API Gateway, CDK, EventBridge, IAM, Elasticsearch, Step Functions

GCP: FirebaseAuth, Firestore, Firebase Hosting, Cloud Storage, Cloud Run, API Gateway

WORK EXPERIENCE

Amazon Software Development Engineer 2

Sep 2020 - Sep 2025

UI & Product Feature Work (Typescript, React, Java)

- Rebuilt advertiser portal tables using AgGrid React library, enabling inline and bulk editing; avoiding a slow full-page editing flow and saved customers ~14,000 hrs/year across the platform.
- Removed unnecessary Elasticsearch round-trip API calls by switching to client-side sort/filter for campaigns with ≤ 100 orders (95% of campaigns) — improved search times from seconds to milliseconds.
- Built web-based IO contract signing UI with React, replacing an email-based approval flow and letting advertisers complete contracts directly on the platform - eliminating manual email correspondence saved hours every week.
- Implemented UI with React and backend in Java to support programmatic ads with new approval step function and pricing api integration. New inventory enabled 100s of millions in additional yearly revenue.

Backend & Systems (Java)

- Engineered a bidirectional Salesforce $\leftrightarrow$ Amazon integration for advertisement campaign proposal service — inbound calls authenticated via IAM; outbound calls routed through a Salesforce-owned API Gateway. Drove alignment across multiple stakeholder groups enabling sales of campaigns valued ~\$100M.
- Designed an SNS/SQS notification pipeline in Java/AWS to maintain data continuity for partner teams during a major service migration — worked directly with the consuming team to define the notification schema and payload fields they needed, safeguarding millions in advertisement revenue with zero disruption.
- Identified and optimized high-latency calls to GraphQL APIs during an on-call investigation by introducing multithreading for concurrent API calls in a Java microservice, reducing page load times by 50%+.

Data Pipeline & Infrastructure (Java)

- Proposed and built a DynamoDB $\rightarrow$ S3 $\rightarrow$ AWS Glue pipeline in a Java AWS Lambda service enabling BI self-serve SQL queries, saving 100+ engineering hours/year and eliminating ad hoc report requests from the backlog.
- Led full deprecation of a legacy monolith reclaiming ~50 eng-hours/quarter previously consumed by maintenance overhead — designed replacement microservices, directly coordinated with dependent partner teams to remove their dependencies, and oversaw production data validation. Supervised intern who supported code migration.
- Caught and resolved a production data corruption issue before client billing during a high-stakes launch — ran exhaustive production validation before re-release with no further issues, protecting customer trust.

Personal Projects (<https://github.com/terryr1?tab=repositories>)

Sep 2025 - Present

Kailaido - AI Powered Dashboard Generator (Go, React/Typescript)

- Designed and shipped a full-stack AI agent that streams OpenAI responses and parses structured JSON actions to generate and mutate a live UI dashboard in real time - live at beta.kailaido.com.

EDUCATION

Northeastern University - Bachelor of Science in Computer Science and a minor in Mathematics

Sept 2016 - May 2020
